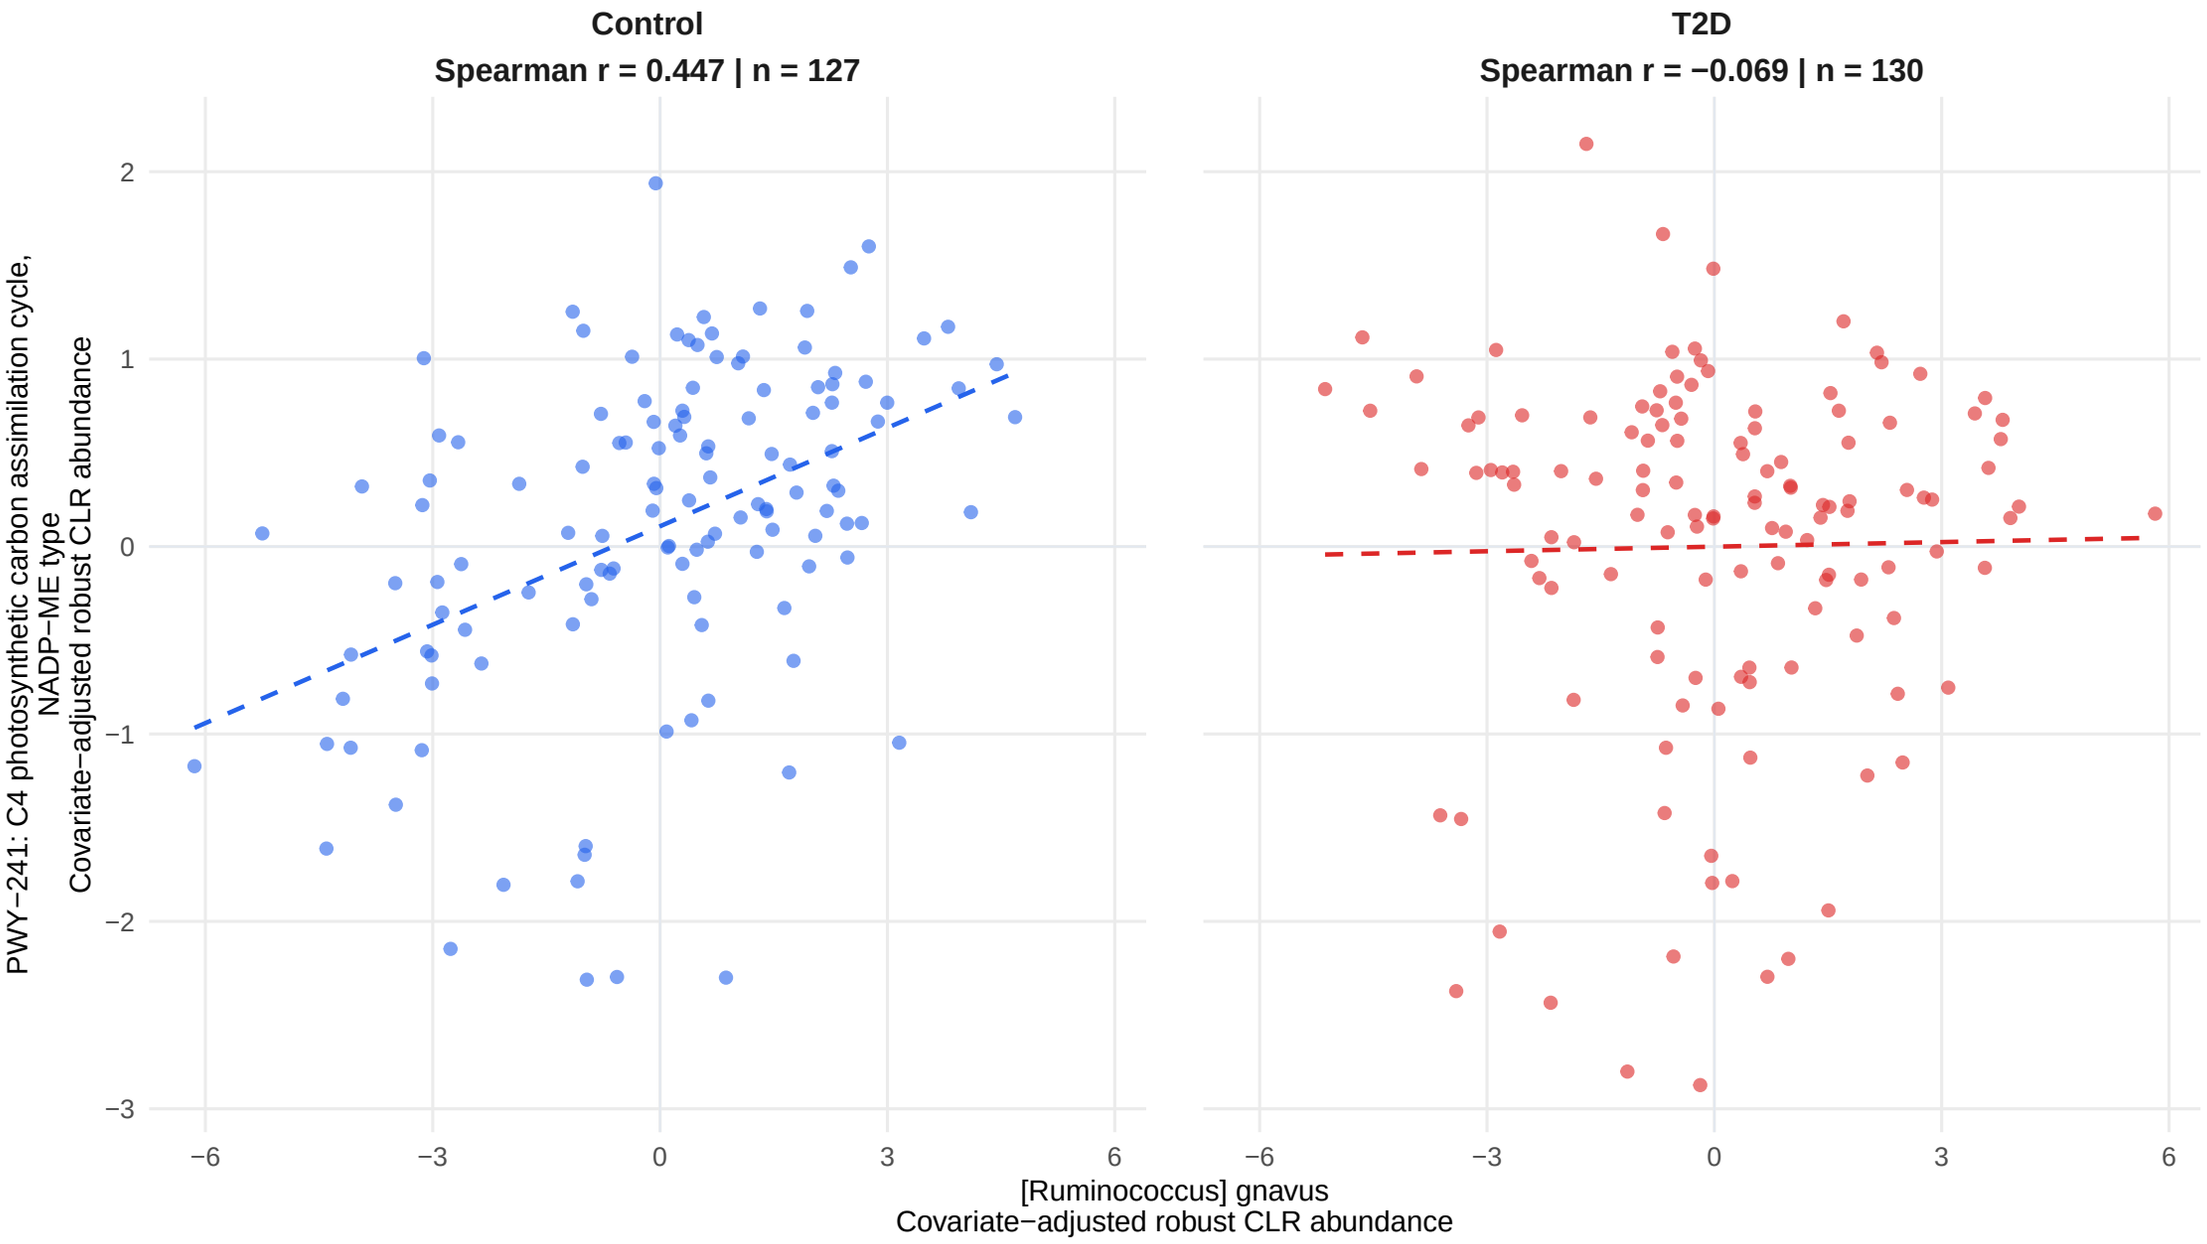
Differential correlation 1 of 1

[Ruminococcus] gnavus vs PWY−241: C4 photosynthetic carbon assimilation cycle, NADP−ME type

Differential p = 2.27e−05 | adjusted q = 2.91e−01



Each point is one sample. Identical axis scales across groups within each page.
Inputs are robust CLR abundances residualized against gender and BMI separately within each group.
Only complete residual pairs are plotted; abundance zeros remain missing.
Dashed lines: linear visual guides; annotations report saved Spearman correlations. Pairs ranked by differential q, then p; selected DISCO filter = 0.005.
