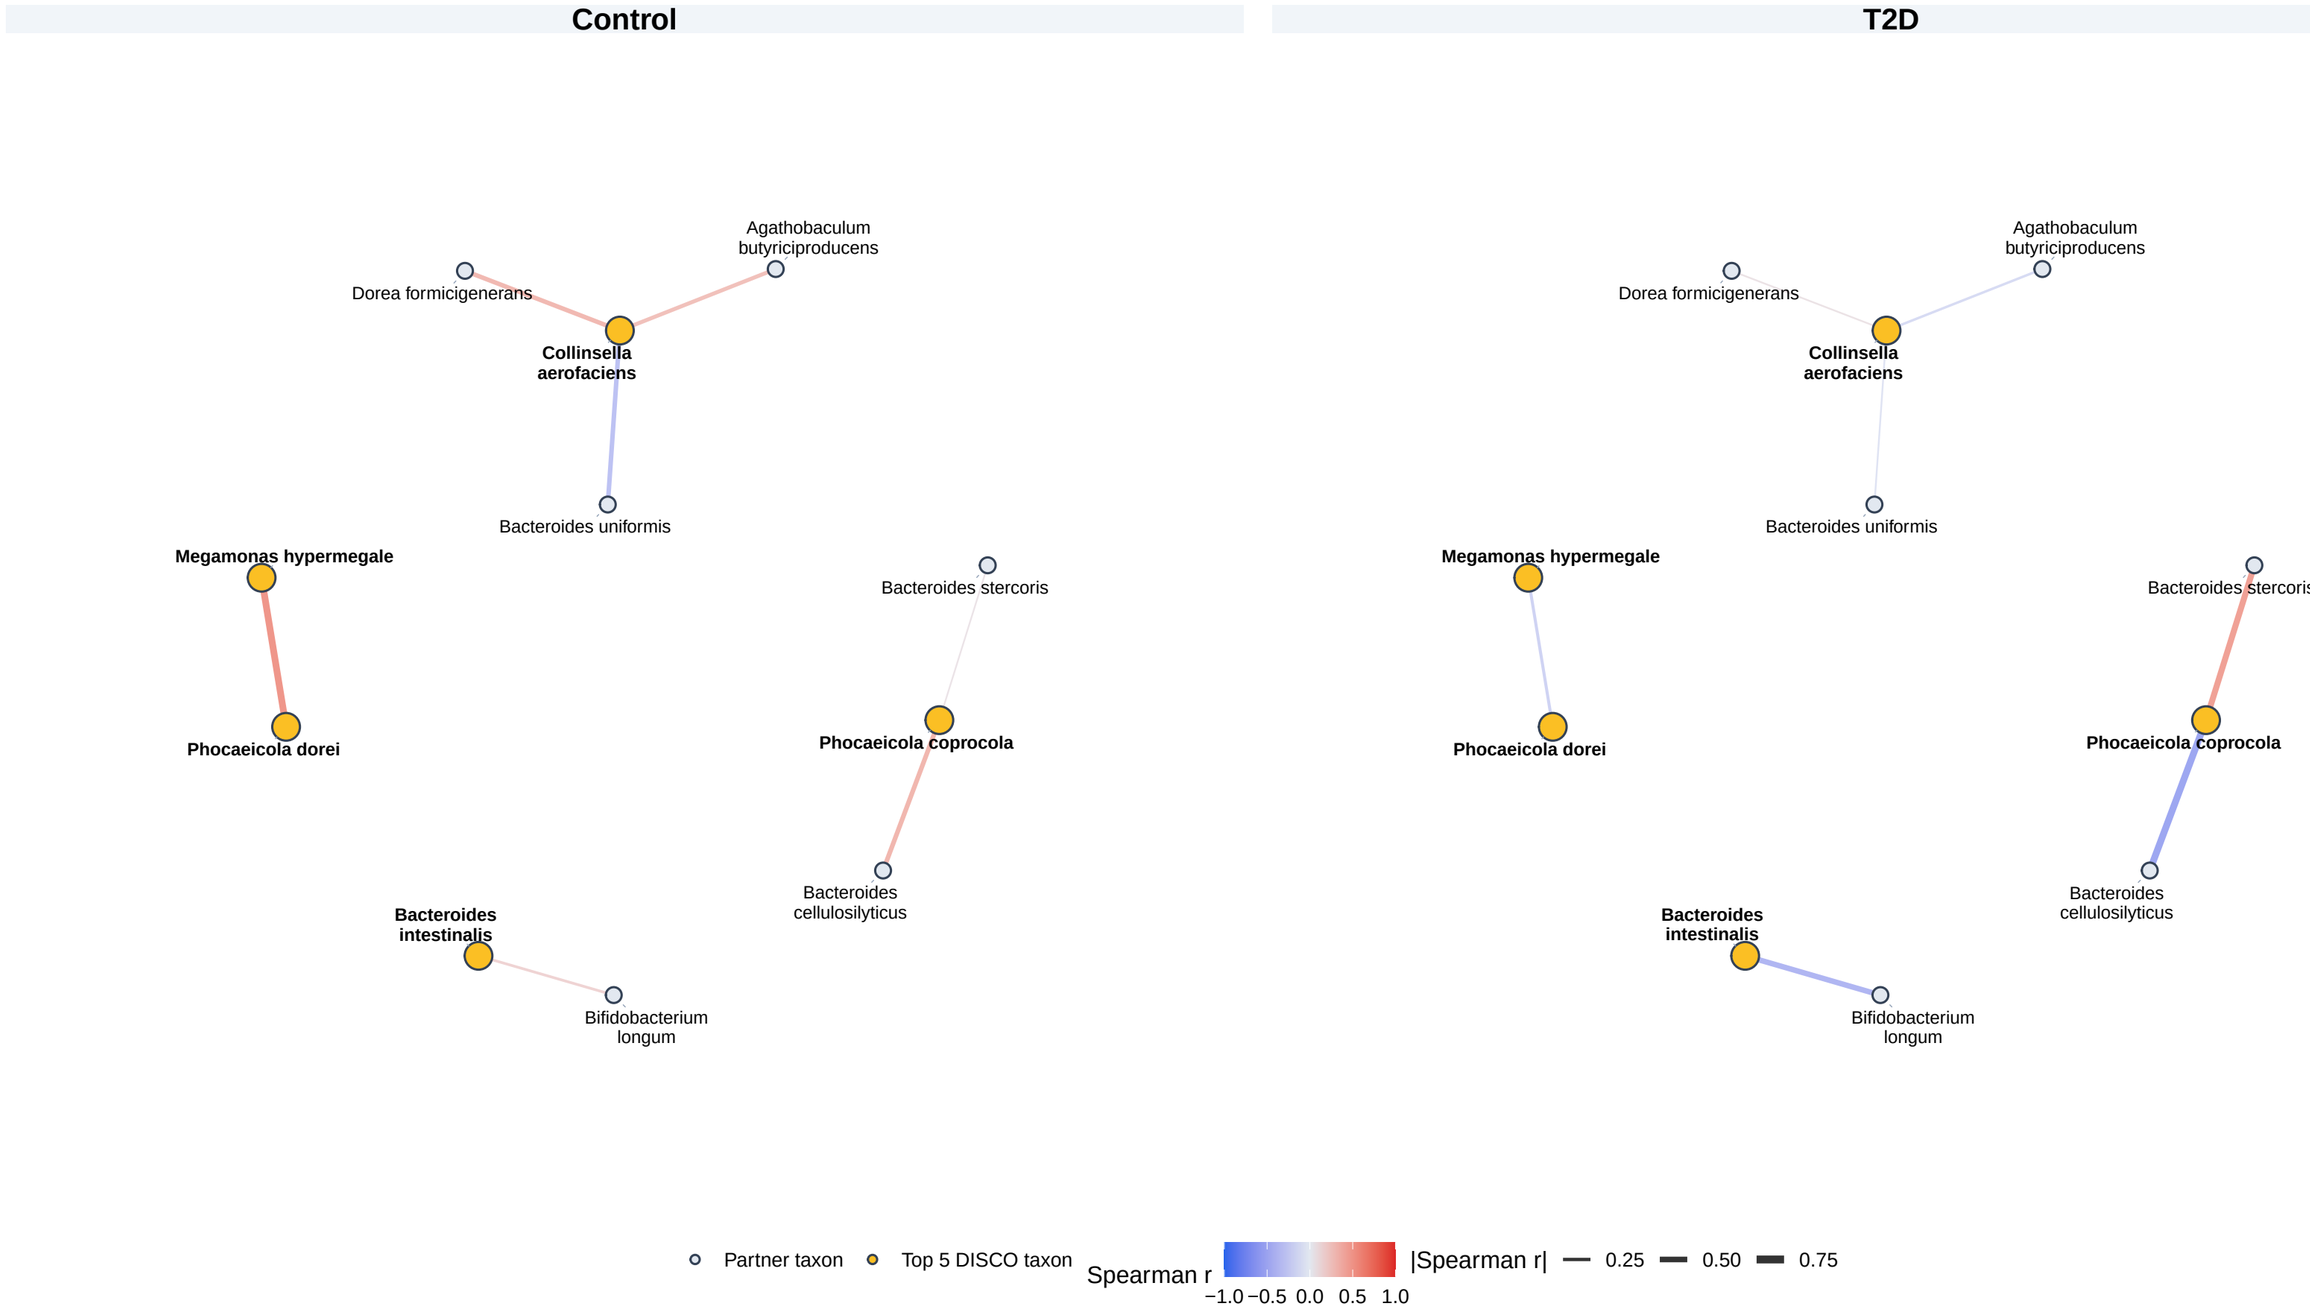
Combined correlation networks of the top 5 DISCO taxa

Top taxa: DISCO q < 0.2 | Edges: differential−correlation p < 0.05 | 11 taxa, 7 unique pairs per group



Gold nodes and bold labels: top 5 taxa ranked by DISCO q, then p. Identical nodes, edges and positions in both groups.
Red: positive correlation; blue: negative correlation. Width: |r|. Inputs: robust CLR (zeros left NA), adjusted for gender and BMI within each group.
Edges connect a selected top taxon to its differential−correlation partners; presence does not imply within−group significance. Raw edge p−values are unadjusted. Selected DISCO filter: 0.001.
