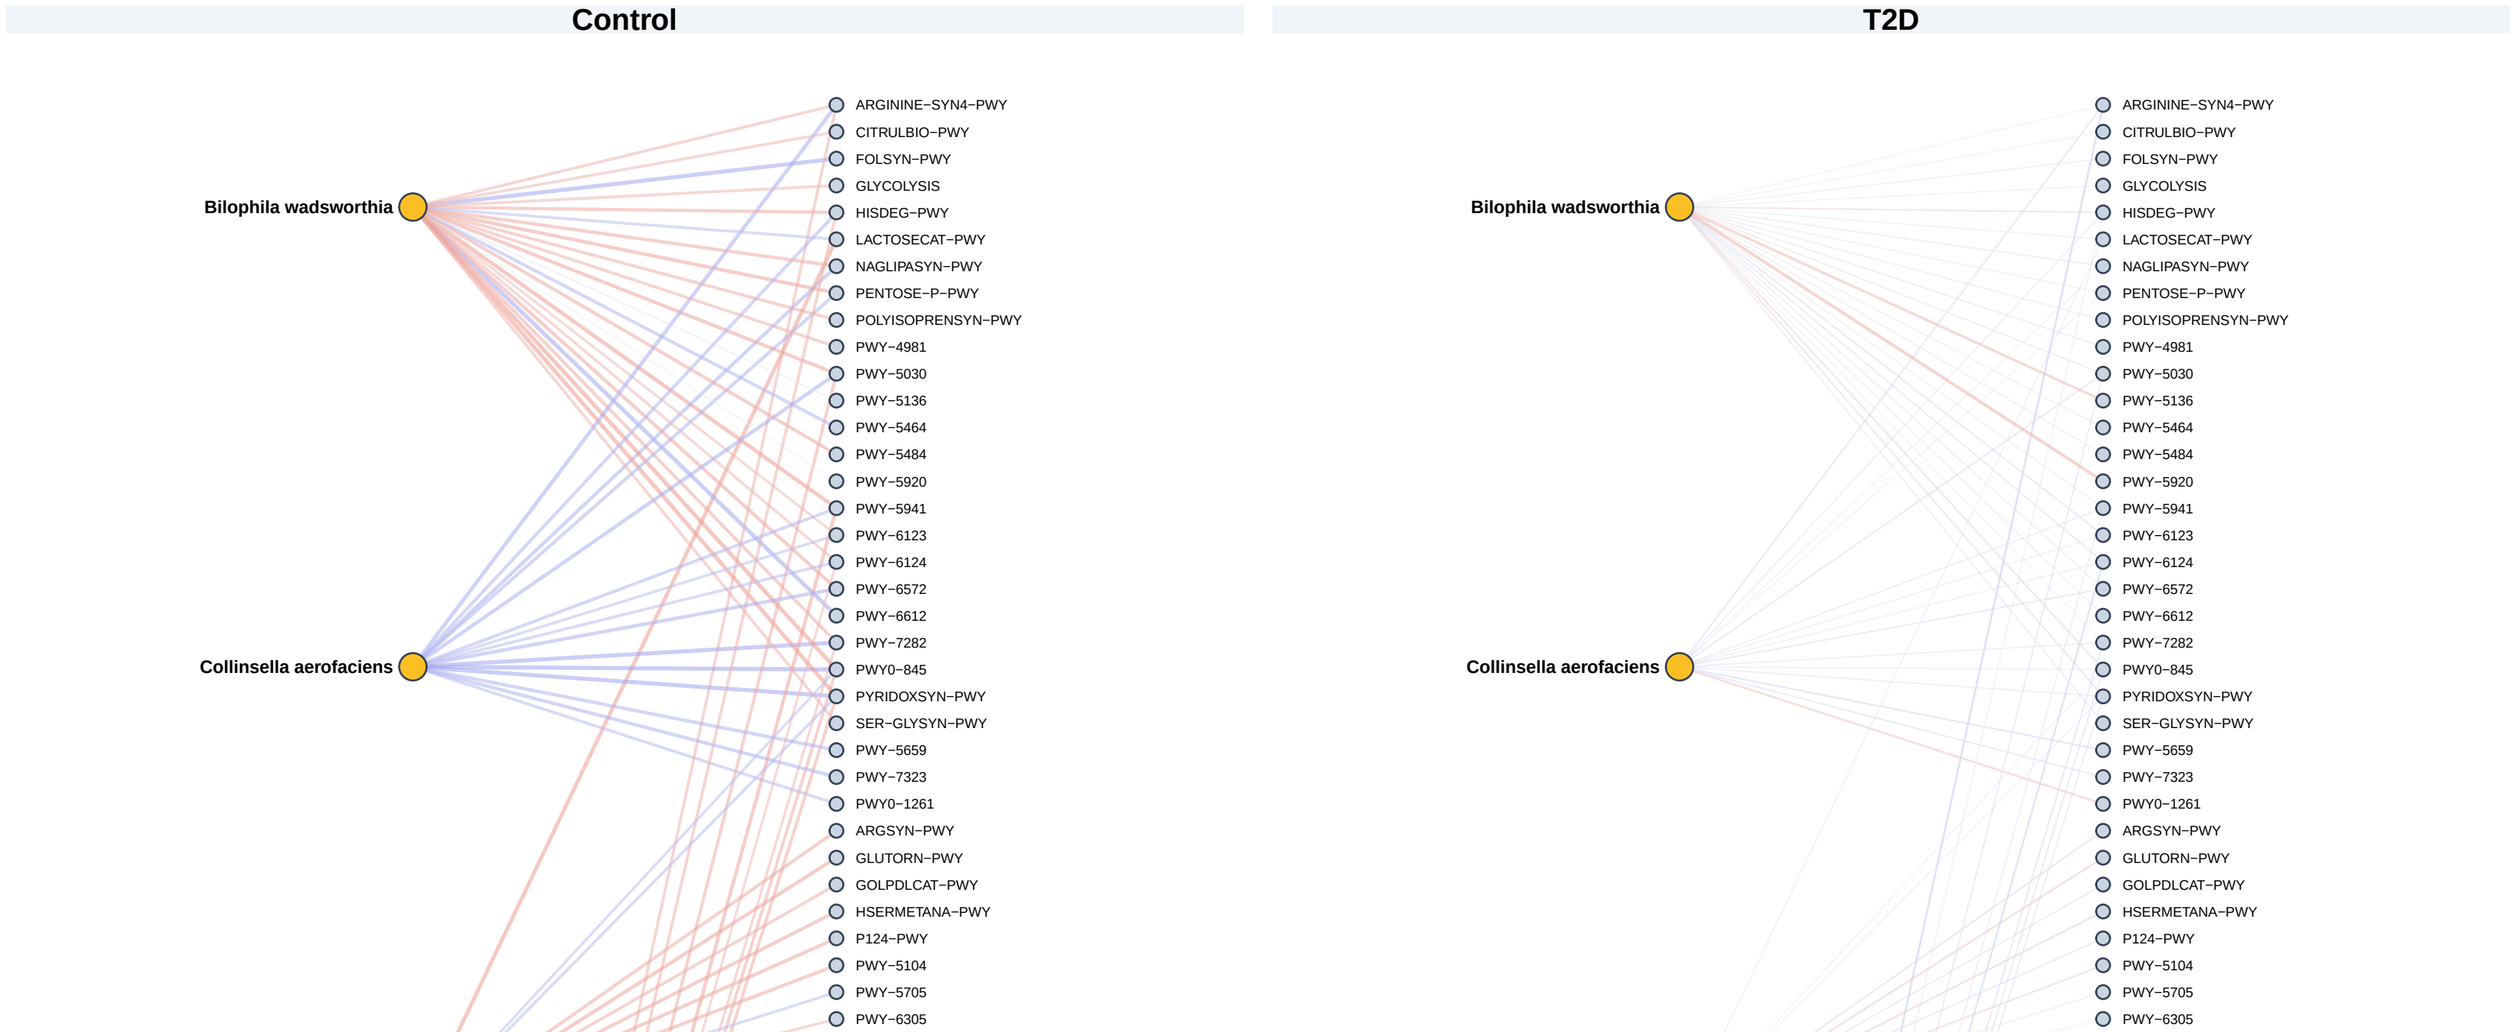
Taxon−pathway networks of the top 5 DISCO taxa

Top taxa: DISCO q < 0.2 | Edges: differential−correlation p < 0.05 | 5 taxa, 77 pathways, 100 pairs per group



Gold nodes: top taxa ranked by cross−modality DISCO q, then p. Grey nodes: pathways (IDs shown; full names in network_nodes.csv).
Red: positive correlation; blue: negative correlation. Width: |r|. Identical nodes, edges and positions in both groups.
Inputs: robust CLR (zeros left NA), adjusted separately within each group for gender and BMI.
Raw edge p−values are unadjusted and do not imply within−group significance. Selected DISCO filter: 0.005.
